Chapter 1 Electromagnetic Field Theory

1-1 Electric Fields and Electric Dipoles

$$\text{Gauss's law : } \iiint_s \vec{E} \cdot d\vec{S} = \frac{Q}{\epsilon_0} = \frac{1}{\epsilon_0} \iiint_v \rho dv' \xrightarrow{\text{divergence theorem}} \iiint_v \nabla \cdot \vec{E} dv' = \frac{1}{\epsilon_0} \iiint_{v'} \rho dv' \Rightarrow \nabla \cdot \vec{E} = \frac{\rho}{\epsilon_0}$$

and $\epsilon_0 = \frac{1}{36\pi} \times 10^{-9}$ (F/m) in the free space.

For q at \vec{R}' , field point at \vec{R} $\Rightarrow \vec{E} = \frac{q \hat{a}_{RR'}}{4\pi\epsilon_0 |\vec{R} - \vec{R}'|^2} = \frac{q(\vec{R} - \vec{R}')}{4\pi\epsilon_0 |\vec{R} - \vec{R}'|^3}$ and $\hat{a}_{RR'} = \frac{\vec{R} - \vec{R}'}{|\vec{R} - \vec{R}'|}$.

\vec{E} due to a system of discrete charges: $\vec{E} = \frac{1}{4\pi\epsilon_0} \sum_{k=1}^n \frac{q_k (\vec{R} - \vec{R}'_k)}{|\vec{R} - \vec{R}'_k|^3}$

Volume source $\rho \Rightarrow \vec{E} = \frac{1}{4\pi\epsilon_0} \iiint_{v'} \hat{a}_R \frac{\rho}{R^2} dv' = \frac{1}{4\pi\epsilon_0} \iiint_{v'} \frac{\rho \vec{R}}{|\vec{R}|^3} dv'$

Surface source $\rho_s \Rightarrow \vec{E} = \frac{1}{4\pi\epsilon_0} \iint_{s'} \hat{a}_R \frac{\rho_s}{R^2} dS' \quad \text{Line source } \rho_l \Rightarrow \vec{E} = \frac{1}{4\pi\epsilon_0} \int_l \hat{a}_R \frac{\rho_l}{R^2} dl'$

Eg. Show that Coulomb's law $\vec{F} = \hat{a}_R \frac{q_1 q_2}{4\pi\epsilon_0 R^2} = \frac{q_1 q_2 \vec{R}}{4\pi\epsilon_0 R^3}$, where $\hat{a}_R = \frac{\vec{R}}{R}$, $R = |\vec{R}|$.

(Proof) $\because \vec{F} = q_2 \vec{E}$ and $\iint \vec{E} \cdot d\vec{S} = \frac{q_1}{\epsilon_0} = 4\pi r^2 E$, $\vec{E} = \hat{a}_R \frac{q_1}{4\pi\epsilon_0 R^2} = \frac{q_1 \vec{R}}{4\pi\epsilon_0 R^3}$

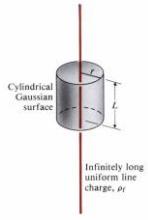

$$\therefore \vec{F} = \hat{a}_R \frac{q_1 q_2}{4\pi\epsilon_0 R^2}$$

Eg. Determine the electric field intensity of an infinitely long line charge of a uniform density ρ_l in air.

(Sol.)

$$\oint_s \vec{E} \cdot d\vec{S} = \int_0^L \int_0^{2\pi} E r d\phi dz = 2\pi L E$$

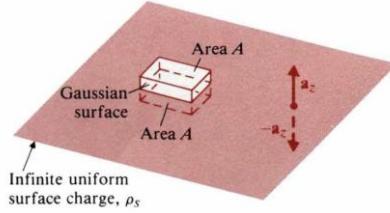

$$2\pi L E = \frac{\rho_l L}{\epsilon_0}, \quad \vec{E} = \hat{a}_r \frac{\rho_l}{2\pi\epsilon_0 r}$$

Eg. Determine the electric field intensity of an infinite planar charge with a uniform surface charge density ρ_s .

$$(Sol.) \oint_s \vec{E} \cdot d\vec{S} = 2ES = 2EA, \quad 2EA = \frac{\rho_s A}{\epsilon_0}$$

$$\Rightarrow \vec{E} = \begin{cases} = z \frac{\hat{a}_z \rho_s}{2\epsilon_0}, & z > 0 \\ = -z \frac{\hat{a}_z \rho_s}{2\epsilon_0}, & z < 0 \end{cases}$$

Eg. A line charge of uniform density ρ_l in free space forms a semicircle of radius b . Determine the magnitude and direction of the electric field intensity at the center of the semicircle. [高考]

$$(Sol.) d\vec{E}_y = -\frac{\rho_l (bd\phi)}{4\pi\epsilon_0 b^2} \cdot \sin\phi,$$

$$\vec{E} = \hat{y} E_y = -\hat{y} \frac{\rho_l}{4\pi\epsilon_0 b} \int_0^\pi \sin\phi d\phi = -\hat{y} \frac{\rho_l}{2\pi\epsilon_0 b}$$

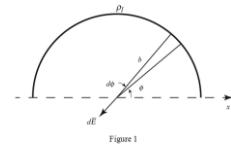

Figure 1

Eg. Determine the electric field caused by spherical cloud of electrons with a volume charge density $\rho = -\rho_0$ for $0 \leq R \leq b$ (both ρ_0 and b are positive) and $\rho = 0$ for $R > b$. [交大電子物理所]

(Sol.)

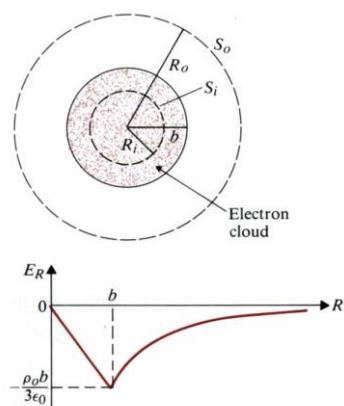

(a) $R \geq b$

$$Q = -\rho_0 \frac{4\pi}{3} b^3, \quad \vec{E} = \hat{a}_R \frac{Q}{4\pi\epsilon_0 R^2} = -\hat{a}_R \frac{\rho_0 b^3}{3\epsilon_0 R^2}$$

(b) $0 \leq R \leq b$

$$\vec{E} = \hat{a}_R E, \quad d\vec{S} = \hat{a}_R dS, \quad \oint_{S_i} \vec{E} \cdot d\vec{S} = E \int_{S_i} dS = E 4\pi R^2$$

$$Q = \iiint_v \rho dv = -\rho_0 \iiint_v dv = -\rho_0 \frac{4\pi}{3} R^3, \quad \vec{E} = -\hat{a}_R \frac{\rho_0 R}{3\epsilon_0}$$

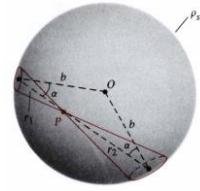

Eg. A total charge Q is put on a thin spherical shell of radius b . Determine the electrical field intensity at an arbitrary point inside the shell. [台大電研]

(Sol.)

$$\rho_s = \frac{Q}{4\pi b^2}, \quad dE = \frac{\rho_s}{4\pi\epsilon_0} \left(\frac{dS_1}{r_1^2} - \frac{dS_2}{r_2^2} \right)$$

$$d\Omega = \frac{dS_1}{r_1^2} \cos\alpha = \frac{dS_2}{r_2^2} \cos\alpha, \quad dE = \frac{\rho_s}{4\pi\epsilon_0} \left(\frac{d\Omega}{\cos\alpha} - \frac{d\Omega}{\cos\alpha} \right) = 0$$

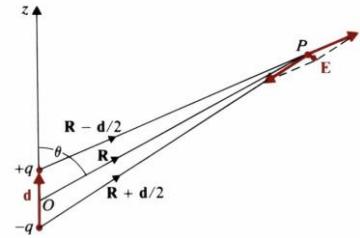

Electric dipole: A pair of equal but opposite charges with separation.

$$|\vec{R} - \frac{\vec{d}}{2}|^{-3} = \left[(\vec{R} - \frac{\vec{d}}{2}) \cdot (\vec{R} - \frac{\vec{d}}{2}) \right]^{-3/2} = [R^2 - R \cdot d + \frac{d^2}{4}]^{-3/2}$$

$$\cong R^{-3} \left[1 - \frac{\vec{R} \cdot \vec{d}}{R^2} \right]^{-3/2} \cong R^{-3} \left[1 + \frac{3}{2} \frac{\vec{R} \cdot \vec{d}}{R^2} \right]$$

$$|\vec{R} + \frac{\vec{d}}{2}|^{-3} \cong R^{-3} \left[1 - \frac{3}{2} \frac{\vec{R} \cdot \vec{d}}{R^2} \right]$$

$$\Rightarrow \vec{E} = \frac{q}{4\pi\epsilon} \left\{ \frac{\vec{R} - \frac{\vec{d}}{2}}{\left| \vec{R} - \frac{\vec{d}}{2} \right|^3} - \frac{\vec{R} + \frac{\vec{d}}{2}}{\left| \vec{R} + \frac{\vec{d}}{2} \right|^3} \right\} \cong \frac{q}{4\pi\epsilon R^3} \left[3 \frac{\vec{R} \cdot \vec{d}}{R^2} \vec{R} - \vec{d} \right] = \frac{1}{4\pi\epsilon R^3} \left[3 \frac{\vec{R} \cdot \vec{P}}{R^2} \vec{R} - \vec{P} \right]$$

$$\left(\begin{array}{l} \vec{p} = \hat{z} p = p \left(\hat{a}_r \cos\theta - \hat{a}_\theta \sin\theta \right) \\ \vec{R} \cdot \vec{p} = p \cos\theta \end{array} \right)$$

$$\Rightarrow \vec{E} = \frac{p}{4\pi\epsilon R^3} \left(\hat{a}_r 2\cos\theta + \hat{a}_\theta \sin\theta \right)$$

Eg. At what value of θ does the electric field intensity of a z -directed dipole have no z -component?

$$(Sol.) \quad \vec{E} = \frac{\vec{p}}{4\pi\epsilon_0 R^3} (\hat{a}_r 2\cos\theta + \hat{a}_\theta \sin\theta), \quad \hat{z} = \hat{a}_r \cos\theta - \hat{a}_\theta \sin\theta$$

No z -component $\Rightarrow 2\cos\theta \cdot \cos\theta - \sin\theta \cdot \sin\theta = 0 \Rightarrow \tan^2\theta = 2 \Rightarrow \theta = 54.7^\circ$ or 125.3°

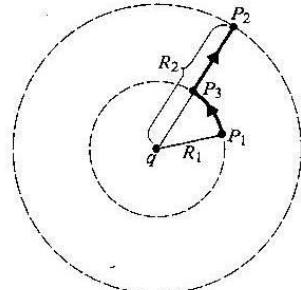

1-2 Static Electric Potentials

$$\vec{E} = -\nabla V \Rightarrow V_2 - V_1 = - \int_{p_1}^{p_2} \vec{E} \cdot d\vec{l} \quad \text{and} \quad \nabla^2 V = -\rho/\epsilon$$

Electric potential due to a point charge:

$$V = - \int_{\infty}^R \hat{a}_R \frac{q}{4\pi\epsilon R^2} \cdot \hat{a}_R dR = \frac{q}{4\pi\epsilon R}$$

$$V_{21} = V_{p_2} - V_{p_1} = \frac{q}{4\pi\epsilon} \left(\frac{1}{R_2} - \frac{1}{R_1} \right)$$

Electric potential due to discrete charges:

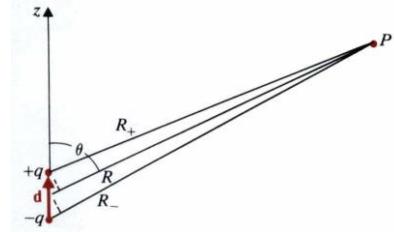

$$V = \frac{1}{4\pi\epsilon} \sum_{k=1}^n \frac{q_k}{|R - R'_k|}$$

Electric potential due to an electric dipole:

$$V = \frac{q}{4\pi\epsilon} \left(\frac{1}{R_+} - \frac{1}{R_-} \right)$$

If $d \ll R$, we have

$$\frac{1}{R_+} \cong \left(R - \frac{d}{2} \cos\theta \right)^{-1} \cong R^{-1} \left(1 + \frac{d}{2R} \cos\theta \right)$$

$$\text{and } \frac{1}{R_-} \cong \left(R + \frac{d}{2} \cos\theta \right)^{-1} \cong R^{-1} \left(1 - \frac{d}{2R} \cos\theta \right)$$

$$V = \frac{qd \cos\theta}{4\pi\epsilon R^2}, \quad \vec{p} = q \vec{d} \Rightarrow V = \frac{\vec{p} \cdot \hat{a}_R}{4\pi\epsilon R^2} \quad (V)$$

$$\Rightarrow \vec{E} = -\nabla V = -\hat{a}_R \frac{\partial V}{\partial R} - \hat{a}_\theta \frac{\partial V}{\partial \theta} = \frac{\vec{p}}{4\pi\epsilon R^3} (\hat{a}_R 2 \cos\theta + \hat{a}_\theta \sin\theta)$$

Scalar electric potential due to various charge distributions:

$$\text{Volume source } \rho \Rightarrow V = \frac{1}{4\pi\epsilon} \iiint_{v'} \frac{\rho}{R} dv'$$

$$\text{Surface source } \rho_s \Rightarrow V = \frac{1}{4\pi\epsilon} \iint_{s'} \frac{\rho_s}{R} dS'$$

$$\text{Line source } \rho_l \Rightarrow V = \frac{1}{4\pi\epsilon} \int \frac{\rho_l}{R} dl'$$

Note: 1. V is a scalar, but \vec{E} is a vector.

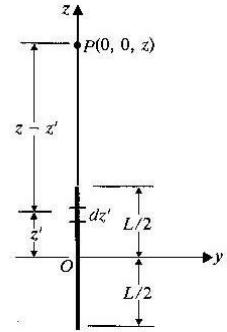

2. $\vec{E} = -\nabla V$ is valid only in the static EM field.

Eg. Obtain a formula for electrical field intensity along the axis of a uniform line charge of length L . The uniform line-charge density is ρ_l . [高考]

$$(\text{Sol.}) \quad R = z - z', \quad z > \frac{L}{2}$$

$$V = \frac{\rho_l}{4\pi\epsilon_0} \int_{-L/2}^{L/2} \frac{dz'}{z - z'} = \frac{\rho_l}{4\pi\epsilon_0} \ln \left[\frac{z + (L/2)}{z - (L/2)} \right], \quad z > \frac{L}{2}$$

$$\vec{E} = -\hat{z} \frac{dV}{dz} = \hat{z} \frac{\rho_l L}{4\pi\epsilon_0 [z^2 - (L/2)^2]}, \quad z > \frac{L}{2}$$

Eg. A finite line charge of length L carrying uniform line charge density ρ_l is coincident with the x -axis. Determine V and \vec{E} in the plane bisecting the line charge.

$$(\text{Sol.}) \quad V = \int_{-L/2}^{L/2} \frac{\rho_l dx}{4\pi\epsilon_0 \sqrt{x^2 + y^2}} = \frac{\rho_l}{2\pi\epsilon_0} \left\{ \ln \left[\sqrt{\left(\frac{L}{2}\right)^2 + y^2} + \frac{L}{2} \right] - \ln y \right\}$$

$$\text{and } \vec{E} = -\nabla V = \hat{y} \frac{\rho_l}{2\pi\epsilon_0 y} \left[\frac{L/2}{\sqrt{(L/2)^2 + y^2}} \right]$$

Eg. A charge is distributed uniformly over an $L \times L$ square plate. Determine V and \vec{E} at a point on the axis perpendicular to the plate and through its center.

$$(\text{Sol.}) \quad \rho_s = \frac{Q}{L^2}, \quad y^2 \rightarrow y^2 + z^2, \quad V = \frac{\rho_s}{2\pi\epsilon_0} \int_{-L/2}^{L/2} \left\{ \ln \left[\sqrt{\left(\frac{L}{2}\right)^2 + y^2 + z^2} + \frac{L}{2} \right] - \ln \sqrt{y^2 + z^2} \right\} dy$$

$$= \frac{Q}{\pi\epsilon_0 L^2} \left\{ \frac{L}{2} \ln \left[\frac{\sqrt{2\left(\frac{L}{2}\right)^2 + z^2} + \frac{L}{2}}{\sqrt{2\left(\frac{L}{2}\right)^2 + z^2} - \frac{L}{2}} \right] - z \cdot \tan^{-1} \left[\frac{\left(\frac{L}{2}\right)^2}{z \sqrt{2\left(\frac{L}{2}\right)^2 + z^2}} \right] \right\}$$

$$(b) d\vec{B} = \hat{z} \frac{\mu_0 (J_{ms} b d\theta)(b \sin\theta)^2}{2(b^2)^{3/2}} = \hat{z} \frac{\mu_0 M_o}{2} \sin^3\theta d\theta, \vec{B} = \hat{z} \frac{\mu_0 M_o}{2} \int_0^\pi \sin^3\theta d\theta = \hat{z} \frac{2}{3} \mu_0 M_o.$$

Eg. Determine the magnetic flux density on the axis of a uniformly magnetized circular cylinder of a magnetic material. The cylinder has a radius b , length L and axial magnetization $\vec{M} = \hat{z}M_0$. [台大物研]

$$(Sol.) \vec{J}_m = \nabla' \times \vec{M} = 0, \vec{J}_{ms} = \vec{M} \times \hat{a}_n = (\hat{z}M_0) \times \hat{a}_r = \hat{a}_\phi M_0, dI = J_{ms} dz'$$

$$\vec{B} = \hat{z} \int_0^L \frac{\mu_0 M_0 b^2 dz'}{2[(z - z')^2 + b^2]^{3/2}} = \hat{z} \frac{\mu_0 M_0}{2} \left[\frac{z}{\sqrt{z^2 + b^2}} - \frac{z - L}{\sqrt{(z - L)^2 + b^2}} \right]$$

Consider an infinitely long solenoid with n turns per unit length around to create a magnetic field; a voltage $V_1 = -n d\Phi/dt$ is induced unit length, which opposes the current change. Power $P_1 = -V_1 I$ per unit length must be supplied to overcome this induced voltage in order to increase the current to I . The work per unit volume required to produce a final magnetic flux density B_f is $W_1 = \int_0^{B_f} H dB$.
